

Next Steps: Streaming

- Streaming algorithms to approximate top singular vector in the row arrival model

- [Price '23] shows that if $\sigma_1(A)/\sigma_2(A) \leq O(1)$, then need $\Omega(d^2)$ space to approximate top singular vector

- Price also shows that if $\sigma_1(A)/\sigma_2(A) \geq C\sqrt{\log n \cdot \log d}$, then can approximate top singular vector in $\mathcal{O}(d)$ space

• Can we relax the gap assumption?

- Can we assume random order or some conditions on A to obtain better algorithms?
