Our Results

- A streaming algorithm which can compute $\hat{x}[i]$ such that for $\alpha \leq 1$

  - Obtained by derandomizing [Minton and Price '14]

- The algorithm uses $O(tr \log(n) + \log^2 n)$ bits of space

  - $O(r \log n)$ update time

$$\Pr[\,|x[i] - \hat{x}[i]|\, > \alpha \frac{\|x\|_2}{\sqrt{t}}] \le 2\exp(-\alpha^2 r) + 1/\mathrm{poly}(n)$$

Our Results
