Efficient Linear Sketching

- CountSketch [CW'13] can be applied to a matrix A in nnz(A) time

- Ahle et al., '20 give a sketch S that can be applied to $(A^{\otimes p})^\top$ to obtain $S(A^{\otimes p})^\top$ in $O(p \cdot \text{nnz}(A))$ time

- Large parts of my work:

    - Properties of sketches that we need to solve a problem

    - Constructing sketches that can be applied quickly to the input

Efficient Linear Sketching

- CountSketch [CW'13] can be applied to a matrix A in nnz(A) time

- Ahle et al., '20 give a sketch S that can be applied to $(A^{\otimes p})^{\mathsf{T}}$ to obtain $S(A^{\otimes p})^{\mathsf{T}}$ in $O(p \cdot$ nnz$(A))$ time

- Large parts of my work:

  - Properties of sketches that we need to solve a problem

  - Constructing sketches that can be applied quickly to the input

Coresets

- A weighted subset of points

    - Representative of the whole dataset for given problem

    - Usually constructed via importance sampling
